

Generic Quotation System

Anonymous customers can input quantities of items to make up a quotation
It's expected the quantities use input type range across a defined minimum and maximum
If the user falls within a certain range a certain type of image appears near the range input
All form/image configurations information are pulled from a database via PHP

The user can input personal details to save the quote to the database, for viewing by customer service
Customer service can edit quotation line items, i.e. everything in the Line Item table

The specification is generic enough to allow for any type of product composed of multiple components to be "built". Your client will describe the requirements in their Pitch
