Quotation System

Designed to be a generic system for quotation of service-based projects that have hard components that are built up to become something more complex. Users are to build cost into the components that include ancillaries such as transport and installation, based on a per unit cost.

Customers can "Play with" the quotation system to get a price for their unique requirements. A session will be created upon first visit, and each alteration to the quotation line item should result in a new quote line against that session.

Admins can view fully and partially completed quotations with or without customer details for follow up. All data on customer actions, will remain for further analysis.

The user facing interface will be a single web page that interacts with the server using AJAX calls. All quotation items will be pre-loaded using an MVVM JavaScript framework (Knockout.js)

Admin interface features will be an MVC framework, with a single Controller being brokered via an index.php page, that takes GET and POST parameters to manage interactivity.

The majority of design work needs to be applied to the Customer-facing interface.

Hosting will take place on the domain cari.mba - Code hosted away from the public in bitbucket.
